03 / 180-second cinematic film

One continuous WebGL camera, ten narrative chapters, media windows, readable motion text and synchronized sound design.

STATUS PROPOSED DIRECTING CONTRACT

Source: njr39/Cerebro-core at 1f78a1295d4dd36a11320995c1e14bf17788ac25. Earlier film-derived Lovart material is a separate reference. The PDFs are production instructions, not an asset approval or tested render.

Timing and deliverable target

FIELD	SOURCE-BOUND VALUE
Duration	180 seconds exactly
Frame clock	30 fps / 5,400 frames / frame indices 0 through 5399
Portrait master target	2160×3840 at 9:16; rendered output not present
Secondary portrait	1080×1920 review/export target
Landscape	3840×2160 composition variant; must be separately framed
Continuous shot	One spatial world and authoritative camera; video edits may occur inside a media aperture
Earlier 150s JSON	Historical; do not mix timings
Earlier Lovart 11 landmarks	Reference schedule; not identical to the current ten-chapter narrative. Reconcile before animating.

Frame evaluation

- At frame f, absolute time t=f/30. Evaluate camera path, target, quaternion, mesh transform, material uniform, active footage frame, editable text, logo, optical pass and sound cue from the same clock.
- Each chapter boundary must preserve camera position and first velocity derivative for position and target. Use quaternion interpolation for orientation; check focus and exposure continuity too.
- Use spline or Bézier paths based on measured world geometry. Control points, FOV and focus distances remain unfilled until the project scene is measured. Null is a blocker, not an instruction to use zero.
- Avoid a hard cut, white flash, teleport, unrelated camera reset or a new renderer. Use physical aperture/rail occlusion and camera parallax for transitions.
- At every frame, test safe subject visibility, media bounds, logo visibility, text clipping and black frames. Inspect chapter joins with a 30-frame window on either side.

Sequential shot list

TIME	CHAPTER	VISUAL STORY
000–012s	Question	Refractive sphere and the question
012–030s	Founder	Tarek Nojara, real portfolio media
030–052s	Cde	Culture & Design Engineering methodology
052–072s	Young Human	Young & Human and Cairo Tower media
072–090s	Co Creation	From destination to collaborative creation
090–112s	Portfolio	Actual film gallery and project proof
112–134s	Cerebro	Enter Cerebro spatial HQ
134–152s	Interaction	Voice, touch and hand tracking
152–168s	Business	CDE education, services, licensing pathway
168–180s	Return	Return to sphere and exploration

Shot-by-shot direction

000–012s / The question

Start from dark spatial distance. Reveal shell through controlled reflection; construct the NOJARA presents opening independently. One short question can appear only after copy approval. The camera approaches on a shallow arc, establishing real parallax.

Camera path / FOV / focus: pending measured scene values. Text and media file IDs: pending approval. Transition out: continuous path through the existing spatial environment.

012–030s / Founder

Pass the shell surface into an approved Tarek portrait medallion and a recessed video aperture. Founder name is prominent. Use actual approved footage; no fake quote or frame. Route the camera onward through the same aperture volume.

Camera path / FOV / focus: pending measured scene values. Text and media file IDs: pending approval. Transition out: continuous path through the existing spatial environment.

030–052s / CDE

Follow a light/data connection into a three-dimensional process graphic. Each ring or line must name a real CDE step from approved copy. Let infographics build sequentially without interrupting camera flow.

Camera path / FOV / focus: pending measured scene values. Text and media file IDs: pending approval. Transition out: continuous path through the existing spatial environment.

052–072s / Young & Human

Reveal the verified Cairo Tower / Young & Human project media in a correctly fitted frame. Clarify the actual Co-Creation Stations, Studios and ACT Awards scope only if approved copy is supplied.

Camera path / FOV / focus: pending measured scene values. Text and media file IDs: pending approval. Transition out: continuous path through the existing spatial environment.

072–090s / Co-creation

Move through linked project nodes as a spatial cause-and-effect network. A connection means an actual documented relation, not decorative data. Keep text short and anchored to the active node.

Camera path / FOV / focus: pending measured scene values. Text and media file IDs: pending approval. Transition out: continuous path through the existing spatial environment.

090–112s / Portfolio

Pan or dolly through at least two genuinely verified moving-media apertures with varied aspect ratios. Each clip retains frame and provenance, with a single optical finish matched across sources.

Camera path / FOV / focus: pending measured scene values. Text and media file IDs: pending approval. Transition out: continuous path through the existing spatial environment.

112–134s / Cerebro

Track inward through a physical aperture into the HQ scene. Preserve sphere scale, lighting logic, camera heading and motion speed. An inner room must be spatially continuous with the outside.

Camera path / FOV / focus: pending measured scene values. Text and media file IDs: pending approval. Transition out: continuous path through the existing spatial environment.

134–152s / Interaction

Show the real voice interface with visible listening/processing/speaking states. Touch and hand tracking are shown as controlled interaction demonstrations only if implemented and testable.

Camera path / FOV / focus: pending measured scene values. Text and media file IDs: pending approval. Transition out: continuous path through the existing spatial environment.

152–168s / Business

Build a visual path from creative production into CDE engagements, training and any real licensing model. Claims of existing revenue, contracts or license terms require evidence before narration.

Camera path / FOV / focus: pending measured scene values. Text and media file IDs: pending approval. Transition out: continuous path through the existing spatial environment.

168–180s / Return

Pull back through established geometry to the original sphere, now narratively changed but visually continuous. Resolve exploration invitation; use the approved NOJARA mark in a distinct outro.

Camera path / FOV / focus: pending measured scene values. Text and media file IDs: pending approval. Transition out: continuous path through the existing spatial environment.

Motion text and copy

- Keep all titles and lower-thirds editable with component ID, exact text, language, entrance and hold frame, safe bounds and output typography variant.
- Move text as a spatial mask or grouped word/line reveal. For Arabic, animate words or lines so joining never breaks; support correct RTL and mixed Latin labels.
- Approved quotes and VO transcript are not in this package. Do not attribute proposed lines to Tarek. Provide a copy register with source/approval per sentence.
- Use one focal phrase at a time and cap captions at two lines per locked app rules unless the film receives a separate approval.

Audio production and mix

• Deliver separate 24-bit/48kHz WAV voice, music, effects and ambience stems when audio is in Lovart scope, plus a synchronized stereo mix and cue JSON indexed by frame.

• Record or license the approved voice; never use a stock narrator and label it Tarek. Align sentence and word timings to actual recorded voice.

• Design restrained glass/metal movement, tactile cues, distant space and aperture transitions. Maintain sound perspective as camera moves; avoid perpetual whooshes.

• Duck score under narration, check intelligibility on phone speaker, measure full 180-second loudness and true peak after encode, inspect mono fold-down and transition seams.

• Earlier Lovart brief suggested approximately -16 LUFS and ≤ -1.5 dBTP. Treat these as provisional delivery targets pending the actual distribution specification; include a measured report, never a claimed value from a mock mix.

• If sound is owned by another team, Lovart delivers frame-accurate visual cue timing and marks AU-001 pending rather than fabricating a mastered audio file.

Film QA gate

FIELD	SOURCE-BOUND VALUE
Whole-film scan	5,400 frames: missing media, black frame, clipping, logo and safe bounds
Camera join scan	Positions, target and velocity at all chapter boundaries
Capture proof	Decoded 2160×3840 frame count and audio length after render
Media review	Actual source, crop, poster and rights for every placed clip
Audio review	Integrated loudness, true peak, phone/mono listening and full sync
Status vocabulary	REQUESTED / GENERATED / REVIEWED / APPROVED / IMPLEMENTATION-READY
